

homework-2

Jay Agustin

Question 1

```
install.packages("aRtsy")
```

The function “install.packages()” lets you download pre-made functions and datasets for use in future sessions. Once you install them, you won’t need to do it again.

The function “library()” loads the installed package in your current R session. It’s similar to checking the box next to the package you want to use in the Packages tab. You might want to dedicate a code chunk to all the packages you’ll use so your document renders properly.
